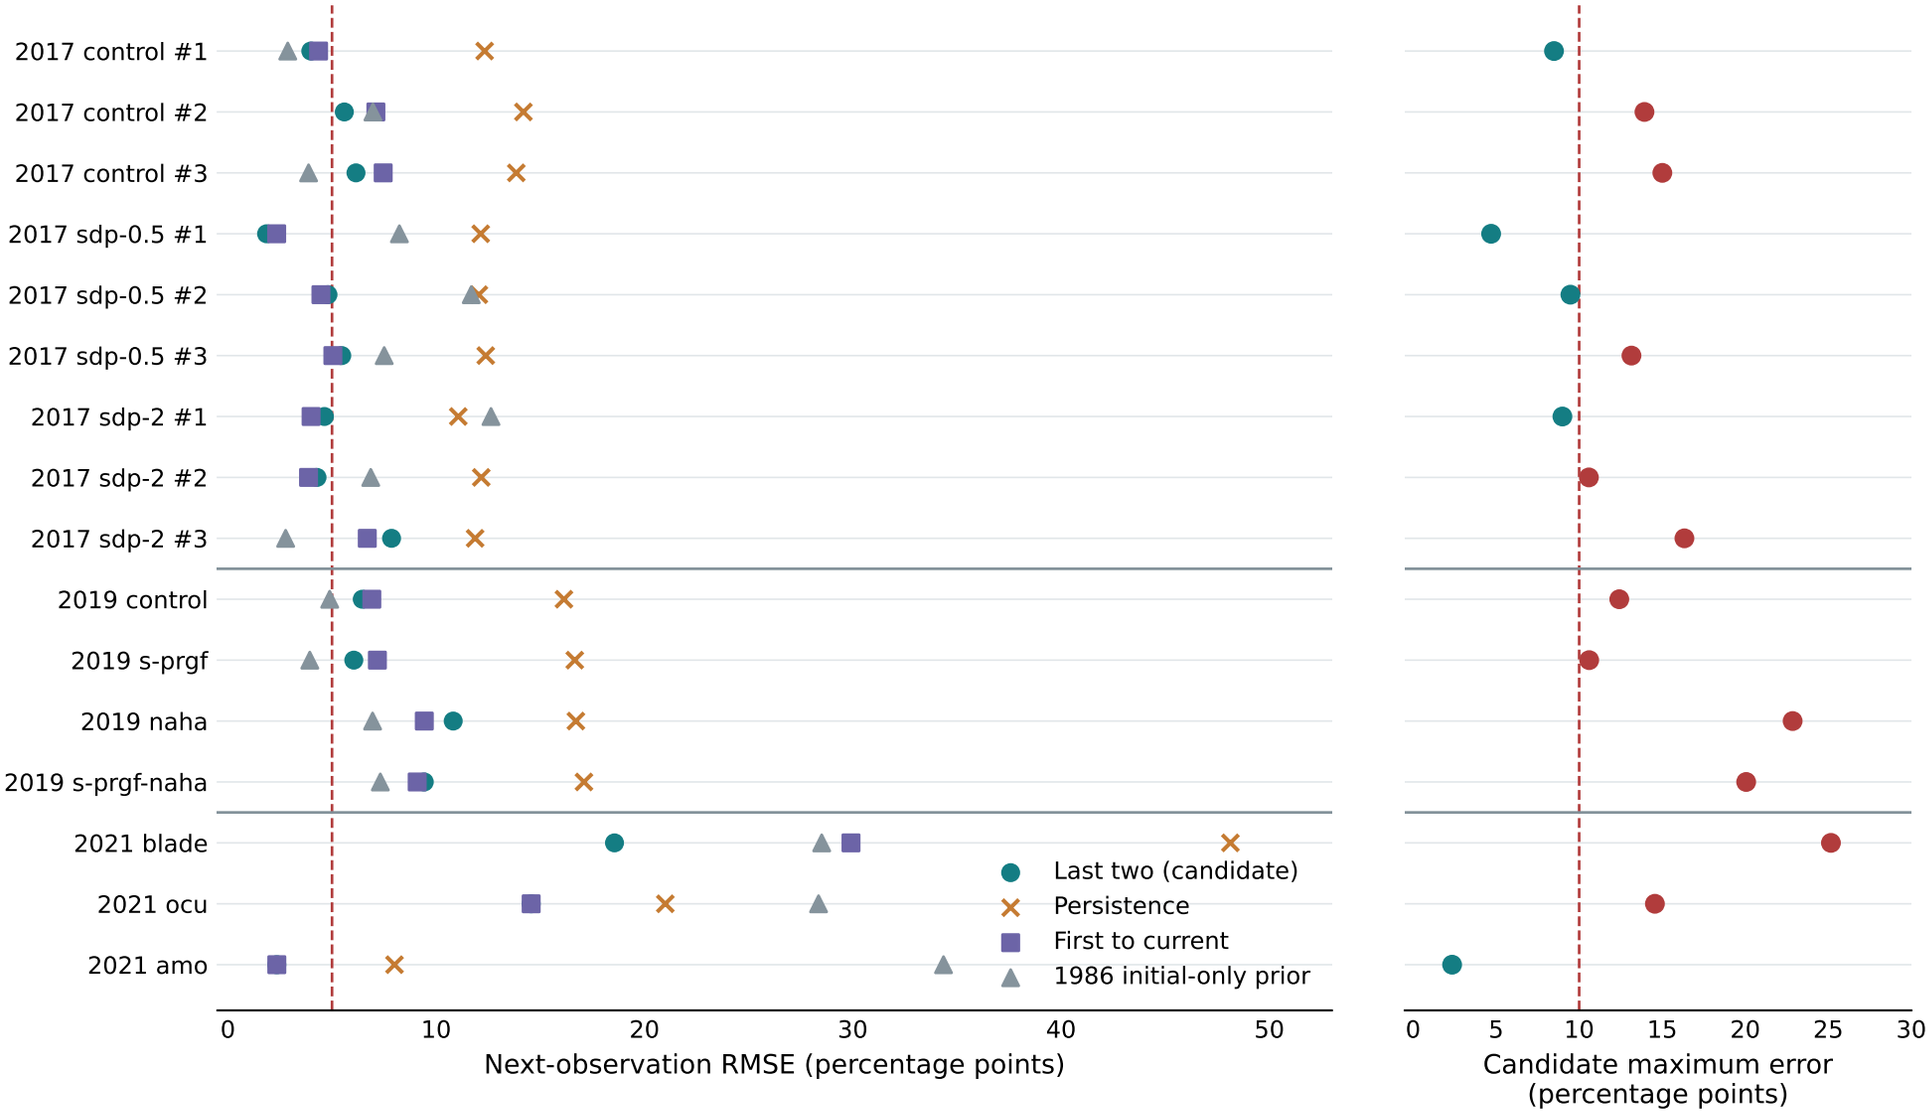
Real observation updates improve persistence, but do not generalize precisely

Retrospective replay: 16 separate series | 98 real child forecasts | 96 numeric targets | only 5 series meet fixed gates



Dashed lines: RMSE 5 pp and maximum error 10 pp. Acceptance also requires at least 0.5 pp RMSE gain over persistence.
2017: individual rabbits, 6h horizons (8 targets each). 2019: cohort means, 12h (5 each). 2021: aggregates, 6h/26h (2/1/1).
Two categorical 50h outcomes are retained without numeric substitution. No pooled acceptance or independent biological validation.
